

EXPERIENCE THE ULTIMATE IN MUSICALITY

Thank you for purchasing Danacable™ digital interconnects. The patent-pending Danacable products will make your audio system perform at its best potential.

Operating Tips for Analog Interconnects

DanaCable digital interconnects come in the following models:

- PureStream™ coaxial digital cable
- TruStream™ USB digital cable

The high-quality connector on the PureStream coaxial cable provides a tight connection with most high-quality digital interconnects jacks. For the RCA connectors, loosen the locking connector until you can insert the tip into the jack without resistance and hand tighten the locking connector (there is no need to over tighten). For the BNC connectors, insert then twist the connector clockwise to install in the BNC jack. Twist the BNC connector counter-clockwise and pull the cable out to uninstall from the jack.

TruStream USB digital cable comes standard with a Type A-connector at one end and a Type-B connector at the other end. For best results, make sure that the connection is firmly in place and the weight of the cable is well supported so as not to put undue pressure on the connectors.

Break-In period

Based on our experience, Danacable requires a break-in period to perform its best. It should sound good right out of the box but will “sing” after about 50 to 100 hours when left undisturbed in place with signal transmitted. One good way to break in is to play a pink noise track from a Test CD repeatedly at low volume for a couple of days before evaluating the cables. Once the cable is installed in one direction, if you reversed the direction of the cable, the sound will be bright and edgy at first but will eventually become smoother and more musical over time. So do keep the cables installed in the same direction as the break-in direction for best results. To make it easier to remember, just keep the arrow and DanaCable name on the logo in the same direction as the signal.

Should you ever misplace this manual, it is also on our website
